

Lecture given at the

WCS Workshop on Land Change Modeling for REDD

October 25– 29, 2010

Wildlife Conservation Society - Bronx Zoo
Bronx, New York, USA

Hosted by

Clark Labs and the Wildlife Conservation Society

This workshop was generously supported by the American people through the United States Agency for International Development (USAID), under the terms of the TransLinks Cooperative Agreement No.EPP-A-00-06-00014-00 to the Wildlife Conservation Society (WCS). TransLinks is a partnership of WCS, The Earth Institute, Enterprise Works/VITA, Forest Trends and the Land Tenure Center. The contents are the responsibility of the authors and do not necessarily reflect the views of USAID or the United States government.

Land Change Modeler™

Introduction to Idrisi Land Change Modeler (LCM)

In this section you will learn:

- LCM Schematic
- Data Preprocessing
- Sequential Categories
- Legend/Palette Creation
- Creating Project Data
- Creating Project Variables

LCM Schematic

Land Cover
Change
Analysis

Land Cover
Change
Prediction

- Hard Prediction
- Soft Prediction
- Road Prediction

Implications
Analysis

- Habitat Suitability
- Habitat Assessment
- Change in Habitat Structure
- Biodiversity Analysis
- Gap Analysis

Land Use
Planning

- Corridor Planning
- Set Incentives
- Set Constraints
- Infrastructure Planning

Data Preprocessing

≠ Rows and
columns

Use **Overlay** or
Window to have
all data in the
same extent

≠ Projection
or offset

Use **Project** or
Resample to
have all data
overlay exactly

≠ Cell size

Use **Expand**
or **Contract** to
change cell
size

RECLASS - image classification / reclassification

Type of file to reclass

- ☒ Image
- ☐ Vector
- ☐ Attribute values file

Classification type

- ☒ User-defined reclass
- ☐ Equal-interval reclass

Input file :

Output file :

Reclass parameters

Assign a new value of	To all values from	To just less than

Use .RCL file... Save as .RCL file... Remove line Clear grid

Output documentation...

OK Close Help

Sequential Categories

0 – Background

1 - Forest

2 – Non Forest

RECLASS - image classification / reclassification

Type of file to reclass:
☒ Image
☐ Vector
☐ Attribute values file

Classification type:
☒ User-defined reclass
☐ Equal-interval reclass

Input file :

Output file :

Reclass parameters

Assign a new value of	To all values from	To just less than

Use .RCL file... Save as .RCL file... Remove line Clear grid

Output documentation...

*Categories must always have the same pixel numbers

Legend Creation

0 – Background

1 - Forest

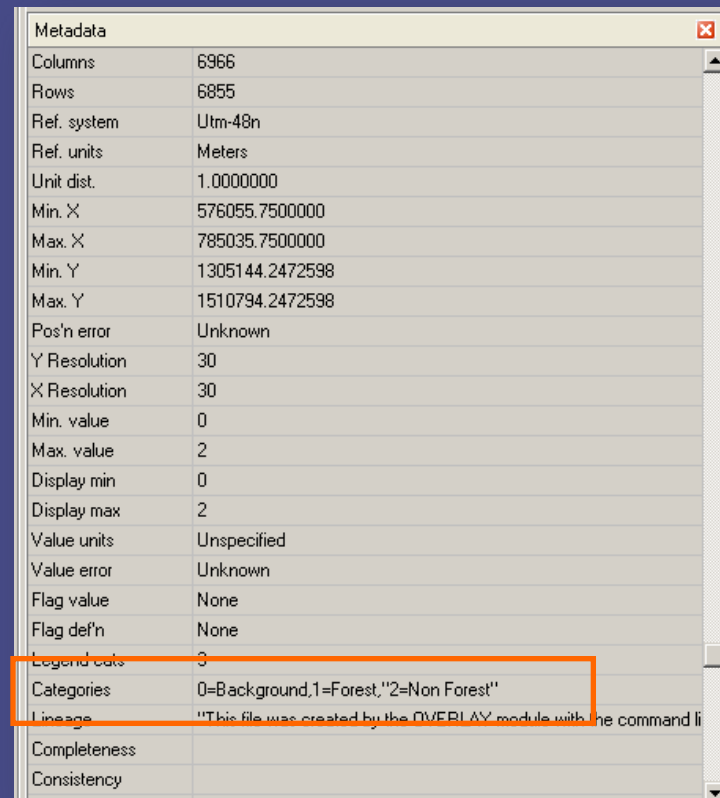

2 – Non Forest

**This legend information
needs to be added to the
image**

- Click on the Files Tab, and find the Categories field in the Metadata window:

Legend Creation

- Fill in the Categories as they correspond to the pixel number:

0 – Background

1 - Forest

2 – Non Forest

Code	Category
0	Background
1	Forest
2	Non Forest

Sequential Categories and Legend Creation

-  Task: Use the **Reclass** tool to change the sequence of the numbers in 60m_landcover_1998_rc image.
-  Task: Go to the Metadata window and scroll down to **Categories**. Click on the ellipsis (...) and enter in names for all of your categories.
-  Task: Click on the Display menu and choose Symbol Workshop. Create a palette that corresponds to your categories for your 60m_landcover_1998 file and save it as 60m_landcover_1998. Close the workshop and reopen your 60m_landcover_1998.

Creating Project Datasets

The Land Change Modeler is able to incorporate a variety of project area variables, which are created from project area datasets.

Examples

- Reference Area
- Project Area
- Leakage Area
- Land Use/Land Cover
- Soil Types
- Roads
- Water Bodies
- Town Locations
- Political Boundaries
- Elevation

Creating Project Datasets

Task: Open the 60m_landcover_1998 land use map in the Input_Raster folder. Add the Roads_1998 vector line file from the Input_Vector folder over the land use map. Choose Outline White as the symbol file. Use RasterVector to make a vector of this point file called Roads_1998 and use the same output reference as one of your landcover maps.

Creating Project Variables

Distance Images

- from features
- from land cover types
- distance vs. cost distance

Elevation Derived Images

- slope
- aspect

Evidence Likelihood

Creating Project Variables

Examples:

Categorical Maps

- Land Use/Land Cover – classify satellite data → reclassify to set categories
- Soil Types – import polygon → convert to raster → reclassify to set categories

Features

- Roads – import line file → convert to raster → Distance
- Water Bodies – import line file → convert to raster → Distance
- Town Locations – import point file → convert to raster → Distance

Terrain

- Elevation → import digital elevation model (DEM) → create Slope and Aspect

Creating Project Variables

Distance Images

Creating Project Variables

Distance Images

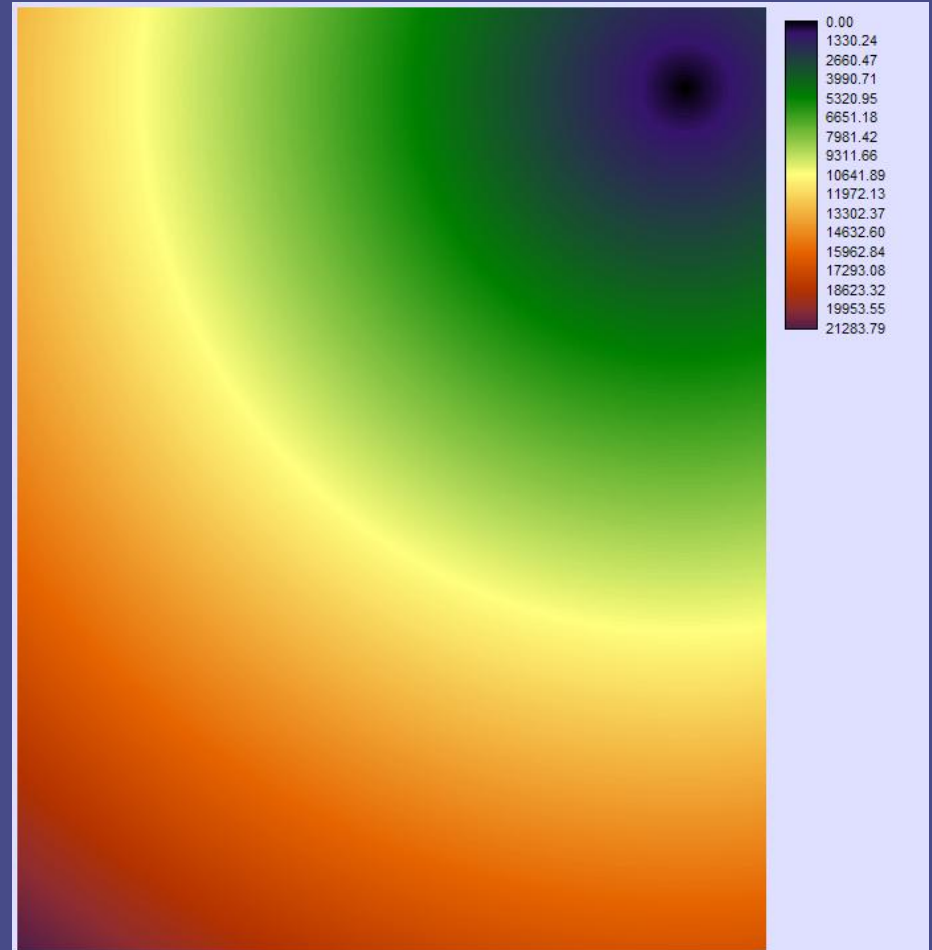

DISTANCE - distance analysis

Feature image:

Output image:

A cost surface contains the minimum cost of reaching a layer from one or more source cells.

Cost can be specified as for example a monetary cost or as the amount of calories it will take to reach a place or the amount of time.

Cost vary across surfaces (e.g is not the same flat surfaces than steep hills) and also across distances (further distance = higher cost).

Cost is specified by friction surfaces- the higher the friction the higher the cost.

Creating Project Variables

-  Task: Create a distance image from the previously rasterized Roads_1998 file.
-  Question: Cost distance requires a friction image. How would you create a friction image from a landcover image?
-  Task: Use the **Cost Distance** module and the cost grow setting and use friction surface to create a cost distance image for the santacruz raster.
-  Task: Use the 60m_elevation DEM image to create slope and aspect images.

Introduction to Idrisi Land Change Modeler (LCM)

You have learned:

- LCM Schematic
- Data Preprocessing
- Sequential Categories
- Legend/Palette Creation
- Creating Project Data
- Creating Project Variables
